Piero S. Friedrich - 100390516

Overview

Book Hub aims to develop a comprehensive book administration system by allowing users to manage their book collections effectively.

Users will be able to create accounts, manage their profiles, and categorize books into different statuses such as Unread, Reading, Read, and Abandoned.

The system will also integrate with external book APIs to display detailed information about each book, including descriptions, author details, and ratings.

The goal is to provide a user-friendly platform for book enthusiasts to track their reading progress, discover new books, and organize their collections seamlessly.

Specifications

Front-end: React, TailWind

Back-end: Node.JS, Express

Data base: Mongo

Possible extra features

Notifications for library due dates and reading reminders.

Friends and Followers at your profile.
